Wealth Concentration in Latin America: sources, methods, and evidence

Part I
Perspective from the developed world

Part II
Focus on Latin America

Facundo Alvaredo

World Bank. 18th April 2023
The distribution of personal wealth is receiving a great deal of attention…

…after being neglected for many years

- **US** (Kopczuk-Saez, 2004; Saez-Zucman, 2016, 2019)
- **France** (Garbinti-Goupille-Piketty, 2017)
- **Spain** (Alvaredo-Saez, 2010; Martínez Toledano, 2018; Alvaredo-Artola, forthcoming)
- **Italy** (Acciari, Alvaredo, Morelli, 2021, 2023)
- **Denmark, Belgium, Germany, Sweden, Switzerland**
- **Credit Suisse** (Shorrocks and Davis), Allianz, Merrill Lynch, UBS,… reports
- **ECB/ONS/FRB** network of wealth surveys, and related papers and reports
- **OECD Guidelines for Micro Statistics on Household Wealth** and Database
- **Luxembourg Wealth Study**
- **World Inequality Report**
- **Etc…**
Reason: average *personal wealth* has increased substantially

E.g.: UK

Source: Alvaredo, Atkinson and Morelli (2018)
Reason: the ratio of private wealth to income has been rising

Net private wealth to net national income ratio in rich countries, 1970–2016

Value of net private wealth (% of national income)

Reason: the ratio of public wealth to income has been declining (cont.)

The share of public wealth in national wealth in rich countries, 1978–2015

- **In 2015, the value of public debt in the US was 146% of net national income, i.e. it was worth 1.5 years of national income.**

- **In 2015, the share of public wealth in national wealth in France was 3% against 17% in 1980.**
  - Net public wealth is equal to public assets minus net public debt. Net national wealth is equal to net private wealth plus net public wealth.

Five potential sources of evidence

1. Multiplied-up inheritance data
   “Estate Multiplier Method”

2. Household surveys

3. Registers or tabulations from wealth tax

4. Multiplied-up capital incomes
   “Capitalization Method”

   - [Census data] [Property taxes data] [cadastral information]
   - [Combination of sources] “Hybrid methods”
## Sources of evidence about the distribution of personal wealth

What is wealth?

- Usually, academic work is concerned with the distribution of personal wealth, or net worth:
  - The value of assets owned by individuals, net of their debts
  - Assets include financial assets (cash, bank accounts, bonds, and company shares) and real assets (houses, farmland, consumer durables, household business assets)
  - Net wealth does not include future wages, pension rights, or future government transfers (social security benefits that are not marketable)

- **Personal wealth** + wealth of non-profit institutions = **Private wealth**

- **Private wealth** + **Public wealth** = **National wealth**
Definitions are important, but often ignored

Unit of analysis:
- individual (estates)
- tax unit (some income tax data)
- household (survey data)
- extended family (rich lists).

Valuation:
- realisation (market) value
- going concern value

Geographical coverage:
- domicile
- residence
- presence.
UK: Top 10% and bottom 90% wealth share since 1895 (inheritance)

Source: Alvaredo, Atkinson and Morelli (2018)

Average wealth of Top 10%: 530 000 £

P90: 215 000 £

Average wealth of Bottom 90%: 50 000 £
Comparison of estimates across methods and debates. E.g. US

- Agreement about the past
- Disagreement about the present
- Confusion between “concentration” and “centralization” due to the lack of theory

Wealth inequality maintained at an extreme level

Average household wealth has more than doubled in Argentina since 1995 but wealth inequality has remained at very high levels, with a top 10% wealth share oscillating between 60 and 70%. In 2021, the top 10% owns €PPP180,300 (ARS 11,903,540) on average, while the bottom 50% own €PPP3,500 or ARS234,090 (less than 6% of the total) in 2021. Argentinian wealth inequality is slightly lower than in the rest of Latin America but remains very high from an international standpoint.

Figure 2: Wealth distribution in Argentina, 1995-2021

Interpretation: In 2021, the wealthiest 10% of the population own 58% of total household wealth. Household wealth is the sum of all financial assets (e.g., stock, bonds) and non-financial assets (e.g., housing), net of debts.

Sources and series: wir2022.wid.world/methodology.
Extreme levels of wealth inequality, still on the rise

Wealth inequality in Brazil is also among the highest in the world. In 2021, the poorest half of the population does not own wealth (compared with 6% in Argentina, for example), whereas the top 1% of the population owns about half of total wealth. Available data suggests that wealth inequality has increased since the mid-1990s in a context of financial deregulation and no major tax reform.

Gender inequality

In Brazil, the female labor income share is equal to 38.5% of all labor income. This is slightly higher

Figure 2: Wealth distribution in Brazil, 1995-2021

Interpretation: In 2021, the wealthiest 10% of the population own 80% of total household wealth. Household wealth is the sum of all financial assets (e.g. stock, bonds) and non-financial assets (e.g. housing), net of debts.
