Describing data LECTURE 15 C4D2@training

The dissemination phase

- Last step of the journey
- Typically, after survey and data processing are concluded, a report is released, aimed at describing main findings from survey

Dissemination of main findings

- Benefits
 Inform general public, researchers, specialists
 Influence policy decisions
 Promote NSO itself: credibility increases through transparency
 ...
- Exposure to criticism and contradiction
 Loss of exclusivity
 Lack of technical capacity to do the dissemination
- Costs
 - Creating and documenting data files
 - Creating access tools and safeguards
 Responding to inquiries

]
The dissemination report	
Varies according to topics of the survey, target audience, etc., but there are some common elements:	
Background information on sampling	
Descriptive statistics (roughly corresponding to survey modules)	
In the case of income and expenditure surveys, measures of inequality and poverty	
Next slides cover these 3 points, with tips for effective presentation and examples.	
C4D2© Training	
	•
1. Background information	
C4D2©training 5	
	1
	1
The need for background information	
The freed for background information	
 Survey reports are usually designed to be accessible to a non- technical audience 	
■ But technical background information must still be present, to inform	
more advanced readers and facilitate comparisons over time and across countries	
 Background information can be presented separately from "core" 	
results, as introductory chapters, appendices, or even a companion document, but must not be omitted	
C4D2©training 6	

What not to miss

- Reports should document at least the following survey design features and processing choices:
- a. Sampling design

Sample size, stratification, representativeness...

- b. Data collection and processing Fieldwork, outlier detection and treatment, data imputation...
- c. Definitions of economic concepts and aggregates used E.g. disposable income, total household consumption, imputed rent... May be presented as a glossary

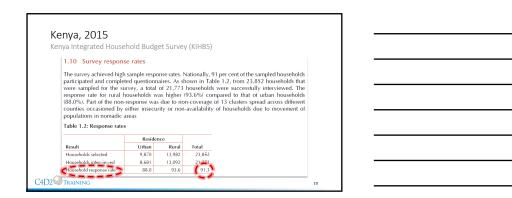

Documentation on sampling design

what to include

- Sampling design report with
 - Allocation of sample into strata and indication of excluded strata, if any
 - Estimation formulas (selection probabilities and weights)
- Household listings forms
- Sample frames
 - For the first sampling stage/s: list of all sampling units
 - For the last sampling stage: list of all households in each sample point $% \left(1\right) =\left(1\right) \left(1\right)$
- Non-response rates
- On the survey datasets
 - Sampling weights

Documentation on fieldwork

what to include

- Training
- Calendar
- Quizzes
- Evaluation forms and selection procedures
- Composition and territorial deployment of the field teams
- Dates of field work
- Problems encountered
- Changes to field procedures
- Supervision forms
- Non-response rates, by interviewer

Uganda, 2016/17

National Household Survey

1.6.3 Fieldwork

1.6.3. Pierwork.
A centralized approach to data collection was employed through which 13 mobile field teams grouped at the UBOS headquarters were deployed to the different sampled areas. Each team comprised one field supervisor, three or four enumerators and a driver. The field staff were recruited based on fluency of the local language sopken in the respective region of deployment while the supervisors were balanced between males and females. Prior to the deployment of fieldwork teams, ten Isiding teams each comprising of a team leader and two listers were constituted to update the number of households within the sampled EAs.

At the headquarters, a team of regional and senior supervisors undertook several other survey activities in line with the survey including data scrutiny, field monitoring, coordination and supervision among others. The field data collection commenced at the end of June 2016 and was completed in June 2017. Fieldwork was carried out in 12 separate trips, between which teams met at the headquarters for refresher training and debriefing sessions. During the meetings, the main issues discussed included logistical and data collection challenges which were resolved instantly.

Documentation on the construction of final databases

- Number of households included
 - Reasons for exclusions
 - Distribution of households
- Number of individuals included
- Unique identifiers
- How to merge files
- Problems encountered
- Methodology to construct aggregates

Egypt, 2015 Household Income, Expenditure and Consumption Survey (HIECS) **Expenditure Aggregates** C4D2 TRAINING

Other documentation

What to include

- Organizations included in preparation of work
- List of data sets and contents
- Codes not found in the questionnaire
 - Occupation codes
 - Industry codes
- Other information

 - Exchange rates Consumer Price Index
- Supervisor control forms
- Questionnaire control forms
- Maps
- Abstract

Tables

- Tables are omnipresent in data dissemination reports
- Often used when describing two variables jointly (two-way tables), e.g. income by region, population by age...

19

Table elements UNECE (2009: 12) Column headers Row stubs Data Notes Source C4D2 Training

What makes a good table

Golden rule #1

Express contents clearly

- 1. The table title should answer the questions "what", "where" and "when", but still be concise
- 2. Tables should be self-contained: use notes to clarify definitions, abbreviations, etc.
- 3. Percentage distributions of discrete variables should be clearly identified as either percentages of households or percentages of the population
- Row and column totals should be reported, when they identify a marginal distribution

C4D2 Training

What makes a good table

Golden rule #2

Reduce clutter

- 1. Avoid unnecessary colors, repetitions (e.g. use % or \$ just once, in the title, rather than throughout the table)
- Precision of numbers: do not present too many significant digits.
 Percentages: one decimal digit is usually enough. Numbers with four or more digits: no decimals at all. Large numbers: express them in thousands or millions
- 3. Be mindful of spacing and alignment

22

What's wrong with this table?

Final energy consumption by sector - Percentages

Graphs

- In many cases, presentation of data can be made more interesting and intuitive by using graphs or charts rather than tables
- Many of the "golden rules" that help make better tables also apply to graphs

C4D2©training

25

What makes a good graph

Golden rule #3

Express contents clearly

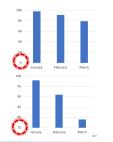

- 1. A good $\operatorname{\mathsf{graph}}$ title answers the same questions as a good table title
- 2. Graphs should be self-contained too (use notes)
- 3. Explain encoding: always label axes and data series clearly
- 4. Avoid visualizations that mislead the eye: two notorious "sins" are bar charts with a nonzero baseline, and 3D pie charts

C4D29TRAINING

26

Bar charts with nonzero baseline

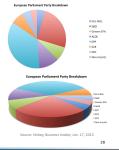

- Bar charts rely on bar length to show data: compare lengths to compare values
- Shifting the baseline distorts the visual: a value twice as high no longer corresponds to a bar twice as long
- Graphs on the right show the same data, but appear very different

C4D2 TRAINING

3D pie charts

- Pie charts encode data in the area of each slice: larger slice equals higher share
- A 3D pie chart distorts angles, making the slice that is "closer" to the viewer appear larger than it actually is
- This visualization can mislead viewers, and should be avoided

C4D2©training

What makes a good graph

Golden rule #4

Reduce clutter

- 1. Again, avoid unnecessary colors and decorative elements that obfuscate the message of the graph
- 2. Precision of numbers: same recommendations as for tables
- 3. Do not crowd graph with too many data points: viewer should be able to understand the message of the graph easily, without having to parse too $% \left\{ 1,2,\ldots,n\right\}$ much visual information (if that is the issue, select a subset of relevant values, or consider using a table instead)

On pie charts

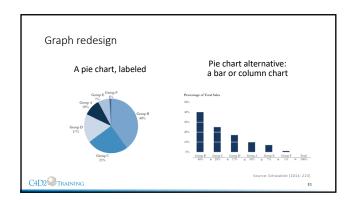

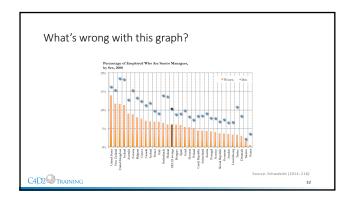

B: A Pie Chart, Rotated

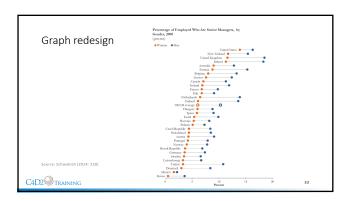

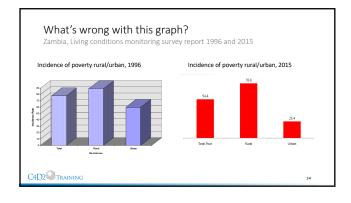

"Because pie charts force readers to make comparisons using the areas of the slices or the angles formed by the slices—something that our visual perception does not accurately support — they are not an effective way to communicate information" Schwabish (2014: 223)

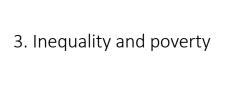

C4D2@training

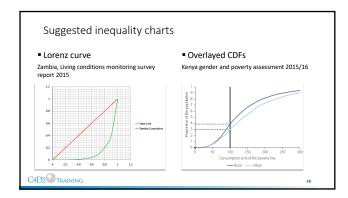

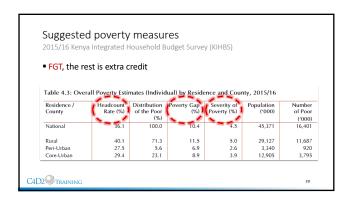

Overview

C4D2@training

- Tips for presentation of generic summary statistics still apply
- There are a few additional points to be made specifically about presenting results on poverty and inequality:
- a. Popular measures and graphics (from lectures 13 and 14)
- b. Best practices for making comparisons

C4D2 Training

Making comparisons

- Many audiences (policy makers, general public) are especially interested in comparisons of poverty and inequality, over time or across regions
- Poverty and inequality trends are among the most visible and impactful results to emerge during dissemination
- Comparability of underlying data and methods is key: if processes that led up to estimates differ, comparison is invalid
- Being transparent on comparability is key!

C4D2@training

40

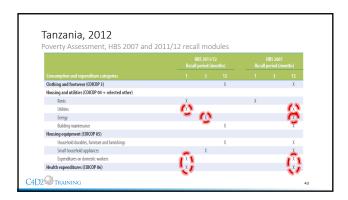

Changes in data and methodology

- Comparability of data and methods underlying the estimates that are being presented is key
- If processes that led up to estimates differ, comparison is invalid and readers may be misled
- Minimize incomparability
- If some discrepancies remain, be fully transparent

C4D2@training

41

Tanzania, 2012 Poverty Assessment The analysis of the poverty trend is challenged by changes in the HBS design, but the adjustments made to counter the change in design support the decline of poverty. Assessing the changes in poverty levels over time is subject to issues of comparability stemming from changes in the survey design and methodological improvements implemented during the 2011/12 HBS. These issues were addressed using different methods, including the revaluation of the consumption aggregates for HBS 2007 using the same approach as in 2011/12, as well as nonparametric and parametric imputation procedures. The different CAPD2©TRANING

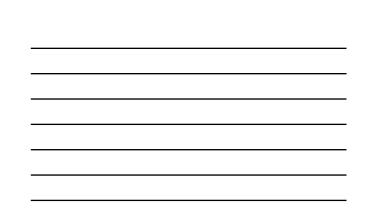

The importance of uncertainty

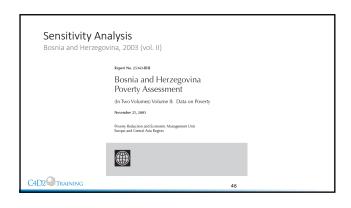

- Poverty calculations are based on a sample of households, and samples carry a margin of error in representing the population
- Standard errors should always be estimated along with poverty point estimates
- Crucial when making comparisons (over time, across regions): poverty changes should not be taken at the face value
- Note: probability weighting, clustering, and stratification, are survey design features which must be taken into account when estimating standard errors.

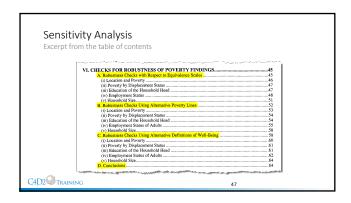

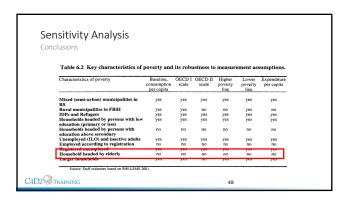

C4D2@training

| Table 9: Poverty indices in 2015/16 | Std. Err. | St

Lessons learned

- 1. Explain clearly what your table or graph is showing (titles, labels, notes...)
- 2. Only if point 1 is checked, reduce clutter: keep frills to a minimum
- 3. When showing results on inequality and poverty, include the shortlist of key measures and graphs indicated in this lecture, which the international community has come to expect $% \left(1\right) =\left(1\right) \left(1\right) \left($
- ${\bf 4.} \quad {\bf Comparisons: } {\bf document} \ {\bf changes \ in \ data \ and \ methodology, \ and}$ include measures of uncertainty of estimates whenever possible
