

C# usage in Survey Solutions

Viktor Gladkikh

Alexandra Komarovskaya

Survey Solutions 05/31/18
C4D2 training
Perugia, Italy

Introduction

- What is the programming language and what it stands for
- What benefits provide usage of programming languages for CAPI
- C# language to power calculation of conditions and validations

Filter

```
!(IsAnswered(season_high) && season_high.Contains(@optioncode))
```

Record answer order

Max number of answers

- Enabling condition (?) Hide if disabled (?)

```
IsAnswered(season_high)
```

Objects

- Questionnaire in Survey Solutions consist of objects
 - Rosters
 - Questions
 - User defined variables, lookups, macroses...
- Each object has attributes and methods for administration
 - Variable name
 - Question text/Section title, question specific properties
- Answers on question has different type from question type

Object types

- Simple types:
 - String
 - “some text”
 - Int
 - Double
 - 3.14159
 - Boolean
 - True/false
- Complex types:
 - DateTime
 - Geo location
 - Audio
 - Yes/No answer
 - Text list question
- Arrays
 - [1, 2, 3, 4]
 - Array can be accessed by index
 - Index start from zero
 - Household[1]
 - Household[2]

Complex types and rosters

- Complex types like DateTime and GPS answer consist of other objects
- To access properties of complex type answer C# syntax use **dot**
- So if we have GPS question `Gps`
 - Then we access it's properties via dot
 - `Gps.Latitude`
 - `Gps.Longitude`
 - `Gps.Accuracy`
- Roster items are also complex types
- Use dot to access roster item variables
 - `Household[0].age`
 - `Household[0].sex`

Operators

- Relational
 - Equal to: `==`
 - Greater, less than:
`>` , `>=` , `=<` , `<`
 - Not equal to: `!=`
- Logical
 - And: `&&`
 - Or: `||`
 - Contrary: `!`
 - If-then: `exp1 ? exp2 : exp3`
- Mathematical
 - Addition: `x + y`
 - Subtraction: `x - y`
 - Division: `x / y`
 - Multiplication: `x * y`
 - Many other operators: [C# Math library](#)
- Object instantiation:
 - `new DateTime(2018, 05, 30)`

Nullability

- Answer on question that is not answered will be **NULL**
- Integer, double and DateTime type cannot be null
- In Survey Solutions answers of those types wrapped in nullable form
- Accessing for value is happen through **.Value** notation
- “Shorthand” is **?.** notation

Enabling condition (?) Hide if disabled (?)

```
date?.Year == 2017
```

Functions

- Function is something that take an input and produce an output
- Function intakes one or more arguments and returns single result

$$\text{function}(x) \left\{ x + 1 \right\}$$

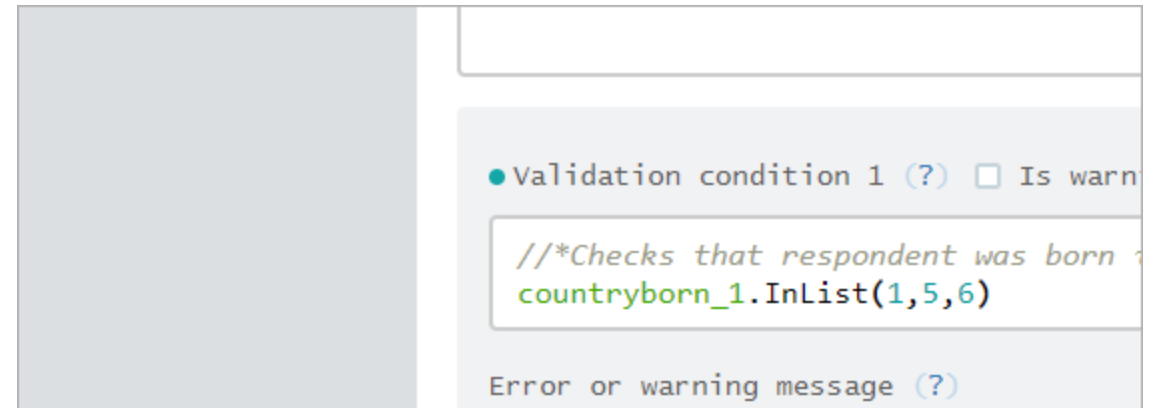

$$\text{function}(2) \Rightarrow 3$$

$$\text{function}(0) \Rightarrow 1$$

Functions

- Functions can have several arguments
- In C# notation function syntax consists of function name, function return type, list of arguments with specified type and a function body

```
int Max(int a, int b)
{
    return a > b ? a : b;
}
```

Type conversion

- In C# one type can be converted into another
- What You need is parenthesis and proper type name
 - `(decimal?) DayOfVisit?.Year`
- Why You needed:
 - Nowadays it's quite rare operation
 - Most of the type conversions happen automatically
 - But sometimes we need explicit type conversion

```
// date of interview must come after, and thus be greater than, DOB  
date_q1 > (new DateTime( (int) date_q2_year, (int) date_q2_month, (int) date_q2_day ))
```

Comments

- It's helpful to comment what do particular number code means
- Two types of comments:
 - `//` - will comment whole line. Text after `//` will be ignored
 - `/* some text */` inline block of comments

```
// either "none" is selected and no other option...  
self.ContainsOnly(1)  
  
||  
  
// ...or there is one or more option selected but it's not "none"  
( self.Length>=1 && !self.Contains(1 /* none */) )
```

Text functions

- Answer on text question has type **String**
- Properties
 - **Q.Length**
- Functions:
 - **Q.Contains(string value)**
 - **Q.ConsistsOf(string chars)**
 - **Q.IsAlphaLatin()**
 - **Q.StartsWith/EndsWith(string val)**
 - **Q.IsNumber()**
- There is also helper functions inside **String** object
 - **String.IsNullOrEmpty(Q)**
- Barcodes are strings

- Enabling condition (?)

```
text4.Contains("a")
```

- validation condition 1 (?) is warning

```
// answer must be at least 10 characters long  
self.Length>10
```

- Validation condition 1 (?) Is warning

```
// string contains more than just white space  
String.IsNullOrEmpty(self)
```

Numeric functions

- Comparison to a range or values
 - `Q.InRange(a, b)`
 - Return true if $a \leq Q \leq b$
 - `Q.InList(a,b,c)`
 - Return true if Q equal to a, b or c
- **Math** object contains a lot of useful mathematic functions
 - Abs, Floor, Max, Min, Pow, etc...
 - You can refer to Survey Solutions Support portal or C# Math class description

● Validation condition 1 (?) Is warning

```
// check that age falls within bounds  
self.InRange(0,120)
```

● Validation condition 1 (?) Is warning

```
// answer must be an integer between 1 and 6  
self.InList(1,2,3,4,5,6)
```

● Validation condition 1 (?) Is warning

```
// check that value is a multiple of 5--that  
(self % 5)==0
```

Error or warning message (?)

Invalid value. Please enter a valid currency

● Validation condition 2 (?) Is warning

```
Math.Max(self, numeric_q1) < 5
```

Error or warning message (?)

Categorical questions

- For single select questions, answer is numeric value
- For Multi-Select question answer is an array of selected codes
- Common functions are:
 - `Q.Contains(value)`
 - `Q.ContainsAll(v1, v2, ...)`
 - `Q.ContainsOnly(v1, v2, ...)`
 - `Q.ContainsAny(v1, v2, ...)`
- Categorical Yes/No question
- Answer on this question is complex type
- It consist of four main parts
 - `Q.Yes`. Contains the values with “yes” answer
 - `Q.No`. Contains the values with “no” answer
 - `Q.Missing`. Contains values without answer
 - `Q.All`. Contains all values answered or not
- All those properties are arrays of codes
- You can use any common functions for single select question

Yes no sample

Question text

FOR A PARTICULAR ITEM
Does your household own any ... ?

501	Mortar/pestle (mtondo)
502	Bed
503	Table
504	Chair
505	Fan

● Validation condition 1 (?) Is warning

```
/* however poor, owns a bed */  
  
// are all items answered (aka does the array Missing have any item values)?  
self.Missing.Any() ?  
  
// if yes, return true--that is no validation error--for now  
true :  
  
// if no, determine whether item 502 (bed) has a "yes" answer  
self.Yes.Contains(502)
```

Error or warning message (?)

Unlikely answer. Most households have a bed

DateTime

- Methods
 - `FullYearsSince(DateTime? Date)`
 - `InRange(DateTime? dateA, DateTime? dateB)`
- Properties
 - `Q?.Year`, `Q?.Month`, `Q?.Day`,
 - `Q?.Hour`, `Q?.Minute`, `Q?.Second`
 - `Q?.DayOfYear`

```
date?.Year == 2017
```

```
date.Value.Year > 2017
```

GPS Location

- Properties:
 - **Latitude**, **Longitude**, **Accuracy** and **Altitude**
- Functions:
 - **Q.InRectangle(north, west, south, east)**
 - **Q.GpsDistance(gps)** distance from **Q** to **gps** in meters
 - **Q.GpsDistanceKm(gps)** distance from **Q** to **gps** in kilometers

● Validation condition 1 (?) Is warning

```
// the second coordinates must be at least 10 meters away from the first coordinates  
gps_q1.GpsDistance(gps_q2)<10
```

● Validation condition 1 (?) Is warning

```
// only accept GPS measures with accuracy of plus or minus 5 meter  
self.Accuracy<=5
```

Text list

- Answer on text list questions is an array of complex type with properties
 - Item1 – is a number
 - Item2 – is a value of text list item
- For example, household_members = [
 - { 1 , “Mary”},
 - { 2, “Paul”}
 -]
- Useful properties are Q.Length for number of items
- For particular item – Q.Item2

- Enabling condition (?) Hide if disabled (?)

```
// enable this only once 1 or more members has been listed  
list_q1.Length>1
```

- Validation condition 1 (?) Is warning

```
list_q1.All(x => x.Item2.Length >= 5)
```

Error or warning message (?)

```
All houshold members should have a name longer then 5 characters
```

[ADD NEW VALIDATION RULE](#)

Lambda and LINQ

- Useful functions
 - `Q.Count(x => x)`
 - `Q.Where(x => x)`
 - `Q.Select(x => x)`
 - ...
- For example
 - `Members.Count(person => person.sex == 1)`
 - `Members.Where(person => person.age > 15).Min()`
 - `Foods.Select(item => item.weight * item.calories).Sum()`

Exercise

1. In dwelling section ask the household owner - do they own a car, a garage, a microwave, a fridge or a washer
2. Ask the owner of the household to answer where they park a car for the night if there is no garage in the answer
3. Ask where household members wash their clothes if there is no washer
