The Financial Premium and Real Cost of Bureaucrats in Businesses

Ana Paula Cusolito, Roberto Fattal-Jaef, Fausto Patiño Peña, Akshat Singh

MENA Chief Economist Office BBL

6/15/2023

A 10

Motivation

• "Bureaucrats are still in business despite more than a decade of divestiture efforts and the growing consensus that governments perform less well than the private sector in a host of activities" (WB, 1995).

イロト イヨト イヨト イヨト

Motivation

- "Bureaucrats are still in business despite more than a decade of divestiture efforts and the growing consensus that governments perform less well than the private sector in a host of activities" (WB, 1995).
- Resurgence of the debate about the role of the State in the economy:
 - Increasing and large State footprint in local and global markets (WB, 2023, Agarwal et al., 2019)
 - EMDE's limited fiscal space and debt distress. Need reforms to rebuild fiscal buffers (WB and IMF, 2023)
 - Evidence that, on average, SOEs underperform POEs (Ehrlich et al., 1994; Karpoff, 2001; Boeing et al., 2016; Wei et al., 2017, Harrison et. al. 2019)

Motivation

- "Bureaucrats are still in business despite more than a decade of divestiture efforts and the growing consensus that governments perform less well than the private sector in a host of activities" (WB, 1995).
- Resurgence of the debate about the role of the State in the economy:
 - Increasing and large State footprint in local and global markets (WB, 2023, Agarwal et al., 2019)
 - EMDE's limited fiscal space and debt distress. Need reforms to rebuild fiscal buffers (WB and IMF, 2023)
 - Evidence that, on average, SOEs underperform POEs (Ehrlich et al., 1994; Karpoff, 2001; Boeing et al., 2016; Wei et al., 2017, Harrison et. al. 2019)
- Contentious but (mis)informed debate
 - Evidence is, mainly, China-centric (Dollar and Wei, 2007; Hsieh and Klenow, 2009; Whited and Zhao, 2021)
 - Lack of broader characterization to shed light on differences across countries, sectors, and overtime for evidence-based policymaking
 - Measurement concerns: (i) evidence focuses on factor markets, (ii) intentional misreporting due to rent-seeking behavior and/or political patronage (OECD 2020), (iii) indivisibilities in the use of public capital and free-riding problems across State firms/agencies (Lefebvre et al., 2018)

- Explore the distortionary effect of State-ownership on (mis)allocation and TFP using a mirror approach.
 - Theory: build on the Whited and Zhao (2021) model, that is the financial mirror of Hsieh and Klenow (2009) framework
 - Data: create a new firm-level dynamic database that provides a full characterization of the ownership structure of a firm, based on Orbis, Vintage Ownership Disks, for 24 European countries during the period 2010-2016 (Cusolito and Vranic, 2020)
 - Empirics: estimate the effect of State-ownership distortions on the average cost of production through the financial channel

- Explore the distortionary effect of State-ownership on (mis)allocation and TFP using a mirror approach.
 - Theory: build on the Whited and Zhao (2021) model, that is the financial mirror of Hsieh and Klenow (2009) framework
 - Data: create a new firm-level dynamic database that provides a full characterization of the ownership structure of a firm, based on Orbis, Vintage Ownership Disks, for 24 European countries during the period 2010-2016 (Cusolito and Vranic, 2020)
 - Empirics: estimate the effect of State-ownership distortions on the average cost of production through the financial channel
- Policy counterfactual analysis to quantify the productivity (output) gains from SOE-related structural reforms: (i) shut down SOEs, (ii) targeted approach, (iii) targeted approach coupled with fixing markets before reallocating resources.

 On average, SOEs get subsidized access to financial resources. A 1 p.p increase in government direct shareholding reduces the average cost of production through the financial channel (e.g., debt and equity) by 0.02 percent, with no differences between publicly listed (PL) and non-PL SOEs.

< □ > < □ > < □ > < □ > < □ >

- On average, SOEs get subsidized access to financial resources. A 1 p.p increase in government direct shareholding reduces the average cost of production through the financial channel (e.g., debt and equity) by 0.02 percent, with no differences between publicly listed (PL) and non-PL SOEs.
- Largest State-ownership subsidy in sectors that are the greatest facilitators of the economy like financial services (0.37%), agriculture (0.09%), electricity (0.07%), water (0.06%), transport (0.05%).

イロト イヨト イヨト

- On average, SOEs get subsidized access to financial resources. A 1 p.p increase in government direct shareholding reduces the average cost of production through the financial channel (e.g., debt and equity) by 0.02 percent, with no differences between publicly listed (PL) and non-PL SOEs.
- Largest State-ownership subsidy in sectors that are the greatest facilitators of the economy like financial services (0.37%), agriculture (0.09%), electricity (0.07%), water (0.06%), transport (0.05%).
- Policy counterfactuals
 - Scenario #1: elimination of SOEs coupled with reallocation of finance towards the private sector subject to financial frictions lead to moderate gains in some economies and moderate losses in many others (-22.2%, 11%)

イロト 不得 トイヨト イヨト

- Financial distortions as drivers of real misallocation
 - Cusolito et.al. (2022), Whited and Zhao (2021), Gopinath et al., (2017), Buera and Moll (2015), Midrigan and Xu (2014), Moll (2014), Buera et al., (2011), Mendoza (2010), Banerjee and Duflo (2005)
- State-ownership as drivers of financial distortions
 - Fang et. al., (2022), Brandt et al., (2021), Jurzyk and Ruane (2021), Bai et. al., (2018), Wei et. al., (2016), Song et. al. (2011), Hsieh and Klenow (2009)
- Our work: SOEs as drivers of real misallocation through the financial channel for a large sample of EMDEs in Europe, while most of the literature is China-centric

• Hsieh and Klenow (2009): real (mis)allocation from factors to output

$$Y_i = A_i K_i^{\alpha} L_i^{\theta}$$

• Whited-Zhao (2021): real (mis)allocation from finance to factors to output

Finance $(D, E) \longrightarrow$ Factors $(L, K) \longrightarrow$ Output

$$Y_{i} = A_{i} \left[\alpha D_{i}^{\frac{\gamma-1}{\gamma}} + (1-\alpha) E_{i}^{\frac{\gamma-1}{\gamma}} \right]^{\frac{\gamma}{\gamma-1}}$$

• γ : deviation from Modigliani-Miller

・ロト ・四ト ・ヨト ・ヨト

• Given prices of debt and equity, cost minimization requires:

$$\min_{D_i,E_i} \left\{ (1 + \tau_{D_i}) r D_i + (1 + \tau_{E_i}) \lambda E_i \right\}$$

s.t.

$$A_{i}\left[\alpha D_{i}^{\frac{\gamma-1}{\gamma}}+(1-\alpha) E_{i}^{\frac{\gamma-1}{\gamma}}\right]^{\frac{\gamma}{\gamma-1}}=\overline{Y}_{i}$$

• Equalization of debt/equity ratios unless there are distortions

$$\frac{D_i}{E_i} = \left[\frac{\alpha}{1-\alpha} \frac{(1+\tau_{E_i})\lambda}{(1+\tau_{D_i})r}\right]^{\gamma}$$

KEY: data on debt and equity holding to back out distortions

• We work with Orbis firm-level financial and ownership files to construct an unbalanced panel with information for 24 European countries during the period 2010-2016. Countries

< □ > < □ > < □ > < □ > < □ >

- We work with Orbis firm-level financial and ownership files to construct an unbalanced panel with information for 24 European countries during the period 2010-2016. Countries
- Orbis finance module: we build on to clean financial raw files. Appendix B of the paper has a detailed routine (Cusolito and Didier, 2020). We use unconsolidated data.
- Orbis ownership module: we build on to clean vintage/links files and create ownership trees (Cusolito and Vranic, 2020). Appendix A of the paper has a detailed routine.

Empirical strategy: identification concerns

• Main concern: identifying state-ownership distortions.

< □ > < □ > < □ > < □ > < □ >

Empirical strategy: identification concerns

- Main concern: identifying state-ownership distortions.
- WHY? Restrictive theoretical underpinnings of the HK (WZ) framework left researchers uncertain as to what distortions capture.
 - Elasticity of prices to technological improvements is -1 and constant markups.
 - Firm-level evidence for the U.S suggests that industry-level elasticities are generally substantially less than 1, and overall, closer to 0.5 or 0.6 (Haltiwanger, Kulick, and Syverson 2018).
 - Evidence for Argentina (Chen and Juvenal 2016), Chile (Cusolito, García-Marín, and Maloney 2017), Colombia (Eslava and Haltiwanger 2017), India (De Loecker et al. 2016), and Slovenia (De Loecker and Warzynski 2012) show imperfect pass-through.
 - Relaxation of restrictive assumptions implies that distortions may confound differences (across firms) in
 - technology (Kasahara, Nishida, and Suzuki, 2017)
 - markups (David and Venkateswaran, 2019)
 - quality (Krishna, Levchenko, and Maloney, 2018)
 - adjustment costs (Asker, Collard-Wexler, and De Loecker, 2014)
 - risk and uncertainty (Doraszelski and Jaumandreu, 2013)
 - alternatively, mismeasurement (Bils, Klenow, Ruane 2021)

Empirical strategy: core specification

 $\begin{aligned} \ln (\text{Cost of } \text{Cap}_{isct}) &= \alpha + \beta \text{State Ownership}_{isct-1} + \gamma \text{Publicly Listed}_{isct-1} \times \text{State Ownership}_{isct-1} \\ &+ \kappa X[Size_{t-1}, Age_t, TFPQ_{t-1}]_{isct, t-1} + \lambda_c + \lambda_{it} + \lambda_i + u_{isct}. \end{aligned}$ (1)

Heterogeneous effects across sectors

Cusolito, Fattal-Jaeff, Patiño Peña, Singli The Financial Premium and Real Cost of Bureaucrats 6/15/2023 13/35

- We study counterfactual policy scenarios to measure the effects that state ownership and market distortions have on aggregate productivity.
 - To measure these effects, we quantify TFP gains between a counterfactual policy scenario economy, \tilde{Y} , and the economy implied by the data (with distortions), Y:

TFP Gains relative to
$$Y = \left(\frac{\tilde{Y}}{Y} - 1\right) \times 100$$

$$\tilde{\hat{D}}_{si} = \frac{A_{si}^{\sigma-1}}{\sum_{i \notin X_s} A_{sj}^{\sigma-1}} \times D_s, \qquad (2) \qquad \qquad \tilde{\hat{E}}_{si} = \frac{A_{si}^{\sigma-1}}{\sum_{i \notin X_s} A_{sj}^{\sigma-1}} \times E_s. \qquad (3)$$

- We study counterfactual policy scenarios to measure the effects that state ownership and market distortions have on aggregate productivity.
 - To measure these effects, we quantify TFP gains between a counterfactual policy scenario economy, \tilde{Y} , and the economy implied by the data (with distortions), Y:

TFP Gains relative to
$$Y = \left(\frac{\tilde{Y}}{Y} - 1\right) \times 100$$

• We assume that the sectoral levels of D and E do not change.

$$\tilde{\hat{D}}_{si} = \frac{A_{si}^{\sigma-1}}{\sum_{i \notin X_s} A_{sj}^{\sigma-1}} \times D_s, \qquad (2) \qquad \qquad \tilde{\hat{E}}_{si} = \frac{A_{si}^{\sigma-1}}{\sum_{i \notin X_s} A_{sj}^{\sigma-1}} \times E_s. \qquad (3)$$

Optimal Allocation of Financial Resources: Distortions vs. No Distortions

• Firms' optimal debt, D_i and equity, E_i , under financial distortions (economy implied by the data):

$$D_{i} = \frac{\frac{P_{i}(A_{i},\tau_{D_{i}},\tau_{E_{i}})^{1-\sigma}}{\left[\alpha_{s}+(1-\alpha_{s})Z_{j}^{-\frac{\gamma_{s}-1}{\gamma_{s}}}\right](1+\tau_{D_{i}})}}{\sum_{j=1}^{M_{s}} \frac{\frac{P_{i}(A_{i},\tau_{D_{i}},\tau_{E_{j}})^{1-\sigma}}{\left[\alpha_{s}+(1-\alpha_{s})Z_{j}^{-\frac{\gamma_{s}-1}{\gamma_{s}}}\right](1+\tau_{D_{j}})}}{\left[\alpha_{s}+(1-\alpha_{s})Z_{j}^{-\frac{\gamma_{s}-1}{\gamma_{s}}}\right](1+\tau_{D_{j}})}} \times \bar{D}_{s}, \quad E_{i} = \frac{\frac{P_{i}(A_{i},\tau_{D_{i}},\tau_{E_{i}})^{1-\sigma}}{\left[\alpha_{s}Z_{j}^{-\frac{\gamma_{s}-1}{\gamma_{s}}}+(1-\alpha_{s})\right](1+\tau_{E_{i}})}}{\sum_{j=1}^{M_{s}} \frac{P_{j}^{1-\sigma}}{\left[\alpha_{s}Z_{j}^{-\frac{\gamma_{s}-1}{\gamma_{s}}}+(1-\alpha_{s})\right](1+\tau_{E_{j}})}}$$

• Firms' optimal debt, \hat{D}_i , and equity, \hat{E}_i under no financial distortions (efficient economy):

$$\hat{D}_{i} = \frac{A_{i}^{\sigma-1}}{\sum_{j=1}^{M_{s}} A_{j}^{\sigma-1}} \times \bar{D}_{s}, \quad \hat{E}_{i} = \frac{A_{i}^{\sigma-1}}{\sum_{j=1}^{M_{s}} A_{j}^{\sigma-1}} \times \bar{E}_{s}.$$

Aggregation and TFP Gains

• Firm, sector, and aggregate output under financial distortions:

$$Y_{i} = A_{i} \left(\alpha_{s} D_{i}^{\frac{\gamma_{s}-1}{\gamma_{s}}} + (1 - \alpha_{s}) E_{i}^{\frac{\gamma_{s}-1}{\gamma_{s}}} \right)^{\frac{\gamma_{s}}{\gamma_{s}-1}}$$
$$Y_{s} = \left(\sum_{i=1}^{M_{s}} Y_{i}^{\frac{\sigma}-1} \right)^{\frac{\sigma}{\sigma-1}}$$
$$Y = \prod_{s=1}^{s} Y_{s}^{\theta}$$

- Analogous expressions for firm, \hat{Y}_i , sector, \hat{Y}_s , and aggregate output, \hat{Y} , under no financial distortions.
- TFP gains between economy without distortions, \hat{Y} , and economy with distortions, Y:

TFP Gains =
$$\left(\frac{\hat{Y}}{Y} - 1\right) \times 100$$

Key Takeaways - Counterfactual Interventions

- Eliminating SOEs and reallocating resources towards POEs subject to market frictions lead to moderate gains in some economies and moderate losses in many others.
 - Two confounding forces at play drive losses: 1) severity of market distortions and 2) productive SOEs are eliminated from the market. Back

Key Takeaways - Counterfactual Interventions

- Eliminating SOEs and reallocating resources towards POEs subject to market frictions lead to moderate gains in some economies and moderate losses in many others.
 - Two confounding forces at play drive losses: 1) severity of market distortions and 2) productive SOEs are eliminated from the market.
- A targeted intervention at under-performing SOEs results in positive TFP gains for more countries, even under the presence of market frictions.
 - However, if distortions of surviving firms are severe enough, productivity may decline after the targeted intervention as reallocation occurs in a distorted fashion.

- A targeted intervention at under-performing SOEs results in positive TFP gains for more countries, even under the presence of market frictions.
 - However, if distortions of surviving firms are severe enough, productivity may decline after the targeted intervention as reallocation occurs in a distorted fashion.
- A targeted intervention at under-performing SOEs, preceded by a reform that eliminates market distortions, leads to TFP gains in every country.
 - TFP gains from reducing misallocation in financial and real markets range from 19-81 and 14-100 percent, respectively.
