Entrepreneurial Human Capital and Firm Informality

Adilya Abdrazakova ¹ Luis Franjo ¹ Francesco Turino ¹

¹University of Alicante

Workshop on Informality in the Latin America and the Caribbean Region World Bank June 2023

Motivation

- Education and informality are negatively correlated (Ulyssea, 2020).
- Recent literature focuses on workers' education and informality in search and matching models (Haanwinkel & Soares, 2021; Bobba, Flabbi, Levy, & Tejada, 2021; Bobba, Flabbi, & Levy, 2022).
- Entrepreneurs' education is also negatively correlated with informality (La Porta & Shleifer, 2014; Berniell, 2021).
- Firms run by educated entrepreneurs are larger at the opening and grow faster over time (Queiró, 2022).
- Educated entrepreneurs are better at innovation and technology adoption (Nelson & Phelps, 1966; Ciccone & Papaioannou, 2009).
- To what extent is the entrepreneur's human capital responsible for firm informality in developing countries?
- How is this relationship shaped by the degree of financial frictions in the economy? (Franjo, Pouokam, & Turino, 2022)
- How these relationships at the firm level translates into adjustments in GDP and TFP?

Motivation

- Education and informality are negatively correlated (Ulyssea, 2020).

- How is this relationship shaped by the degree of financial frictions in the economy? (Franjo, Pouokam, & Turino, 2022)
- How these relationships at the firm level translates into adjustments in GDP and TFP?

This Paper

- We propose a life-cycle general equilibrium model of entrepreneurship (Erosa, 2001; Buera, 2009; Buera and Shin, 2013) with:
 - educational decisions (college vs. non-college);
 - credit market imperfections;
 - capital-skill complementarity; and,
 - limited tax enforcement.
- The model is calibrated to the Brazilian economy.
- Experiments: educational and financial markets reforms.
- Results (preliminary!):
 - $\bullet \sim$ 20% of the size of the informal economy in Brazil is accounted by entrepreneurial human capital;
 - a joint educational and financial markets reform is more effective in reducing informality;
 - entrepreneurial human capital is an important determinant of income per capita and productivity; and,
 - selection into entrepreneurship may explain the observed decrease in the entrepreneurial earnings skill premium in Brazil.

This Paper

- We propose a life-cycle general equilibrium model of entrepreneurship (Erosa, 2001; Buera, 2009; Buera and Shin, 2013) with:
 - educational decisions (college vs. non-college);
 - credit market imperfections;
 - capital-skill complementarity; and,
 - limited tax enforcement.
- The model is calibrated to the Brazilian economy.
- Experiments: educational and financial markets reforms.
- Results (preliminary!):
 - $\bullet \sim 20\%$ of the size of the informal economy in Brazil is accounted by entrepreneurial human capital;
 - a joint educational and financial markets reform is more effective in reducing informality;
 - entrepreneurial human capital is an important determinant of income per capita and productivity; and,
 - selection into entrepreneurship may explain the observed decrease in the entrepreneurial earnings skill premium in Brazil.

Model: Households

- The economy is populated by overlapping generations of individuals who die at age J. Mandatory retirement age $J_R < J$. No pensions.
- Human capital stage (age j = 0): educational decision (h), college or non-college ⇒ h ∈ {s, u}.
- During her working life $(1 \le j < J_R)$ and based on (state variables):
 - educational attainment, h;
 - financial wealth, a; and,
 - managerial ability (conditional on education), e_h ∈ Θ_h, constant during her lifetime and distributed according to a generalized Pareto;
- a household chooses:
 - occupation: worker or entrepreneur; and,
 - how much to consume (c) and save (a') by maximizing her utility:

$$\sum_{j=0}^{J} \beta^{j} \frac{c^{1-\sigma}-1}{(1-\sigma)}.$$

Model: Human Capital/Education Stage

- Non-college individuals are endowed with a managerial ability, e_u .
- Education (linearly) improves managerial ability by a factor ψ, such that e_s = ψe_u, where ψ ≥ 1.
- An individual, conditional on e_u , chooses between getting educated or not after drawing an idiosyncratic utility cost of attending college, $c \sim U([0, 1])$, augmented by κ (Heathcote, Storesletten, & Violante, 2010):

$$h(e_u,\kappa c) = egin{cases} s & \mathbb{M}^{e_u}(s) - \kappa c \geq \mathbb{M}^{e_u}(u) \ u & otherwise \end{cases}$$

where $\mathbb{M}^{e_u}(h)$ is the expected value, upon entering the working stage, for an individual of unskilled ability e_u who has chosen education level h.

 κc includes (in a reduced form) psychological and pecuniary costs of education.

Model: Occupational Choice

- Entrepreneur: chooses between being either formal or informal \rightarrow extensive margin of informality.
- Combines her managerial ability, *e_h*, with capital, *k*, skilled, *l_s*, and unskilled labour, *l_u* (Allub, Gomes, and Kuehn, 2022):

$$e_h^\eta \left(\mu l_u^\sigma + (1-\mu)[\iota k^
ho + (1-\iota) l_s^
ho]^{rac{\sigma}{
ho}}
ight)^{rac{1-\eta}{\sigma}}$$

where η , μ , $\iota \in (0, 1)$.

- In the formal sector:
 - Imperfect credit markets \rightarrow collateral constraint: $k \leq \lambda a$.
 - Taxes on personal income (y): $T(y) = \tau_y y$.
- In the informal sector:
 - No credit markets \rightarrow financial autarky: $k \leq a$.
 - No taxes (hidden production). Fined by a surcharge factor, s, with probability: $p(k) = 1/(1 + p_1 exp(-p_2 k))$.
- Worker: is endowed with 1 unit of time that supplies inelastically and receives a gross wage (ω_s or ω_u) conditional on education.

Model: Closing the model

- Financial Intermediaries (perfectly competitive):
 - Receive deposits from households at a risk-free interest rate, r, and rent capital to firms at rental rate r_k . In equilibrium:

$$r_k = r + \delta$$

- Corporate sector:
 - Pays an operational fixed cost (φ_f); cannot engage in informal activities; and, no borrowing constraints. Net output:

$$Y_{c} = A \left(\mu L_{c,u}^{\sigma} + (1-\mu) [\iota K_{c}^{\rho} + (1-\iota) L_{c,s}^{\rho}]^{\frac{\sigma}{\rho}} \right)^{\frac{1-\eta}{\sigma}} - \phi_{f}$$

- Government:
 - The government raises income and consumption taxes to finance public expenditures.
 - Consumption is taxed at a flat-tax rate τ_c .
 - No public debt.

Households' Problem: Timing

- Before her working life, a household decides on her educational attainment (college/skilled or non-college/unskilled).
- During her working life, at the beginning of each working year, a household chooses her occupation (worker or entrepreneur):
 - An skilled or unskilled worker makes optimal decisions for consumption and savings.
 - A college or non-college entrepreneur decides the status of her firm (formal or informal), the inputs, and how much to produce with each technology.
 - After production decisions have been taken, audits take place and fines are enforced.
 - After observing if she was detected or not, an entrepreneur makes consumption and savings decisions.

Occupational Maps and Education

Entreprenurial Human Capital and Firm Dynamics

Mid-ability formal entrepreneur capital and savings decisions over the life cycle conditional on education. Solid lines are savings; stars are capital used in production. Red for college; blue for non-college.

Experiments and Counterfactuals

- Experiments (very long-run):
 - Educational Reform: decrease the cost of getting educated ($\downarrow \kappa$) such that the proportion of college-educated individuals in the working-age population becomes the one in the US (\sim 30%).
 - Financial Reform: improve access to credit by formal entrepreneurs ($\uparrow \lambda$) such that the credit-to-GDP becomes the one in the US ($\sim 160\%$).
 - Both Reforms: bring Brazil to the US in terms of credit-to-GDP and the proportion of the college-educated population.
- Counterfactuals:
 - No Entrepreneurial Human Capital ($\psi = 1$). Role of Education of Entrepreneurs?

Conclusions

- Structural dynamic model of occupational choice with human capital (both workers and entrepreneurs) and firm informality.
- A financial reform or an educational reform, separately, does not eliminate informality (larger effect of educational reform).
- A joint reform further reduces informality because of capital-skill complementarity.
- Entrepreneurial human capital potential important determinant for informality, official GDP, measured TFP, and fiscal revenues.
- Accounting for informality is crucial for the reforms:
 - Amplification effect: from informal to formal.
 - \uparrow extensive margin.
- Education accounts for a large proportion of informality (\sim 85%, in the counterfactual with the US college rate);
 - $\bullet~\sim$ 20% explained by entrepreneurial human capital.
- Selection into entrepreneurship may explain the observed decrease in the entrepreneurial earnings skill premium.

Next Steps

- Calibration:
 - Improve (targets?).
 - Production function.
 - $\psi(e)$. Proportion of educated entrepreneurs by firm size.
- Empirical Analysis:
 - Cross-country comparisons.
 - Educational reforms in Brazil (Haanwinkel & Soares, 2021).
- Transitional Dynamics:
 - Policy evaluation. Persistence of informality through educational choices.
