Source: World Bank, Global Monitoring Database, May 2024.

Note: Estimates are based on harmonized household surveys in 157 economies, latest data after 2009, that are part of the Global Monitoring Database, Data for Goals, Poverty and Equity Global Practice, World Bank, Washington, DC. The definitions of the indicators and the deprivation thresholds are as follows. Monetary poverty: a household is deprived if income or expenditure, in 2017 purchasing power parity US dollars, is less than US\$2.15 per person per day. The estimates in this table for Australia, Canada, Germany, Israel, Japan, Korea Rep., and the United States are based on the microdata available from the Luxembourg Income Study. Educational attainment: a household is deprived if no adult (grade 9 equivalent age or older) has completed primary education. Educational enrollment: a household is deprived if at least one school-age child up to the (equivalent) age of grade 8 is not enrolled in school. Electricity: a household is deprived if it does not have access to electricity. Sanitation: a household is deprived if it does not have access to limited-standard sanitation. Drinking water: a household is deprived if it does not have access to limited-standard drinking water. The data reported refer to the share of people living in households deprived according to each indicator. – = not available.
