The Covid-19 crisis and the road to recovery: green or brown?

Miria Pigato, Rayan Rafaty and Jonas Kurle

November 16, 2021
The COVID-19 crisis and the road to recovery: green or brown?

➢ Provides an analysis of the climate impact of the fiscal stimulus announced by 85 high-income and emerging and developing economies (EMDEs) from March 2020 to May 2021 to recover from the COVID-19 crisis.

➢ The analysis is based on data from the Global Recovery Observatory (GRO), an initiative launched in 2021 by a team of researchers at Oxford University’s Smith School of Enterprise and the Environment.

➢ It provides some insights on the implications of the fiscal stimulus for the energy transition.
CO2 emissions dropped temporarily - but they are back.

Change in daily CO₂ emissions relative to 2019 by region

Change in daily CO₂ emissions relative to 2019 by sector
A massive fiscal stimulus, mostly in high income countries

**Global stimulus spending** from March 2020 to May 2021: US$19.8 trillion
- 78% in 24 high-income countries
- 22% in 61 EMDEs

Rescue spending: 85%
Recovery spending: 15%

### Average Spending Patterns Across High Income and Emerging and Developing Economies (EMDEs)

Note: aggregate spending amounts in billion US$. Amounts exclude EU and EIB. Source: Staff calculations based on Global Recovery Observatory data (O'Callaghan et al., 2020).
Countries invest in both green and brown activities.
Identifying four different clusters
Countries with good health outcomes, equitable distribution of resources and less corruption are the least likely to invest in brown activities.

Many countries have adopted similar green or brown spending strategies. What can explain the similarity of countries’ spending patterns?

- Countries with relatively **good health outcomes**, **equitable distribution of resources** and **less corruption** are the least likely to belong to the “brown” recovery spending group, and more likely to belong to the clusters with a mix of other types of spending.
  - Greater equity in health system have been associated to more egalitarian values: in turn, these have been associated with greater concern for environmental and climate issues.
  - Higher levels of political corruption have been found to be strongly associated with lower stringency of climate policies.
Investment in clean energy increased but retiring coal remains elusive.
Covid-19: a missed opportunity to build back better

- National responses to the COVID-19 crisis are expected to have a negligible or even adverse climate impact.
  - The size of the stimulus has been extraordinary, but only in advanced countries
  - Spending in response to the Covid-19 crisis has been mostly light brown and brown.

- The COVID-19 response has deepened existing energy trends
  - Some countries – mostly in Europe – are accelerating the energy transition, but most have continued to invest in fossil fuel industries.

- A missed opportunity or a lack of alternatives, given the path dependency of economic systems?
  - Can a crisis achieve anything more than incremental change?
Thank you!
